

Aldeck

BUMPER STOP SYSTEM

The Aldeck Bumper Stop is an advanced safety system engineered to provide an additional layer of protection to prevent mobile construction access equipment (scissor-lifts etc) from unnecessarily hitting the handrail system and potentially falling over the edge of floors on buildings during the construction process.

The unique design holds a consistent perimeter bump stop which alerts plant and equipment operators that they are near the perimeter guardrail system and helps prevent plant from coming into contact with the guardrail system.

This robust and engineered system sits approx. 30mm off the ground to help with de-watering and provides an approx. 80mm overall height.

The bump stop system is designed to attach to our telescopic base post through the same holes eliminating the need for excess holes through your slab.

There is an additional joiner bracket for intermittent fastening and to provide an additional fixing point where one may be needed.
